MisticEase Arc

Drop. Paste. Open.

How it works

MisticEase Arc is a plugin for WordPress. It opens your own files in popups on a page: video, audio, PDF, images, text, and Office documents. Twenty-two file formats are supported.

1. Drop

The work is done in the Palette, a small window that opens over the editor. You drop a file into the Palette. The file is checked and uploaded, and a file code is issued for it.

2. Paste

You copy the code and paste it into your page. Then you save and publish as usual.

3. Open

On the published page, the code becomes a link named after the file. When a visitor clicks the link, the file opens in a popup. The visitor can drag the popup to any position, and it stays open while the page is scrolled. Up to three files of different kinds can stay open at the same time.

Slash Markup

No shortcodes and no custom HTML are needed. When one item should be displayed differently, a short prefix is written before its code. For example, a prefix can turn an image into a thumbnail of a given width, or set the width of a popup. Slash Markup is optional.

This PDF is one of the sample files on the MisticEase Arc page. It is open in a popup right now.
